You are printing for the Pharmaceutical Industry? Your product range includes Braille printing or embossing and thus requires braille testing?

Now this task may be performed by the EyeC Profiler as well as checking for content errors and other flaws.

If equipped with the new Optional Braille Inspection Module, the EyeC Profiler can inspect Labels or Cartons for correct layout and placement of Braille on the packaging material. The braille writing is checked for:

- Correct embossing/printing (Braille points where they should be, no Braille Points where there should be none)
- Quality of embossing/printing quality with the necessary tactility
- Correct placement towards the artwork

This option works with all Braille embossing and Printing. It test the Braille **from the Frontside** of the packaging material, where the tactility is to be guaranteed, not from the backside, where you can easily miss something getting stuck in the cavity of the embossing press!

For ease of use the Braille is decoded and displayed as well. The option uses a PDF as template that complies with the ECMA-Standard for Braille embossing on Cartons (Artwork on the first page, Braille on the second page of the approved PDF-File)

Control and monitor your Braille using the EyeC Profiler and comply with the laws of the regulated pharmaceutical market!
